Check Day and Maintenance Calendar

The monthly look, the annual check day, and the controls that follow special events · belongs with Chapters 6 and 12 · Year: _____

Little, but reliable. A custody setup does not decay in a single day, it decays quietly: a backup has gone unchecked for years, a program is two versions behind, a location has changed and is written down nowhere. This sheet is the countermove. It holds no secrets and may therefore live with your records. **What never belongs on it:** seed words, passphrase, PIN, xpubs, addresses.

1 · MONTHLY: THE LOOK FROM OUTSIDE

Watch-only wallet: balance matches, no unexpected outgoings, no incoming payments without a label. Node: is it running, is it up to date. Needs no device.

Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec

2 · ONCE A YEAR: THE CHECK DAY

No	Step	Done	Result / anomaly
1	**Inspect the seals.** Every sealed bag intact, number matches your record. Costs nothing and comes first.		
2	**Words only when there is a reason.** Do not enter a verified backup into a device every year, every entry is a risk. If in doubt: check on a SeedSigner without internet, reseal, note the number.		
3	**Descriptor in every location.** Multisig only: according to your records the current printout sits with every key backup in an intact bag, and the fingerprints in the descriptor the coordinator shows match those on the system sheet.		
4	**No yearly restore.** Full drill, with multisig also the rebuild from the printout, only at setup and after fundamental changes. Tick means: nothing changed since the last drill.		
5	**One spend, two devices.** Multisig only: the two devices that store their seed (BitBox02 and Trezor in the book) sign one small amount back to your own wallet. Pairs with the SeedSigner only when there is a reason, because it has to load the seed again for that.		
6	**Passphrase backup.** Seal intact, physically separated from the seed, fingerprint noted.		
7	**Software and signatures.** Versions current, signature checked against the noted fingerprint of the signing key. Entry on the signature anchor sheet.		
8	**Inheritance path, heirs' package, policy.** Refresh the timelock (chapter 9) and have a short talk with the heirs: do they still know where the plan is. Read the heirs' package: locations, access routes, order, second factor, renew date and version. With a policy: sum insured against the current price.		
9	**Bring records up to date.** System sheet and emergency note current as of today, destroy the old versions.		

Check day on: _____ · Next date: _____ · Time it took: _____

3 · AFTER SPECIAL EVENTS

Event	What gets checked afterwards	Date / done
Firmware or app update	Receiving address on the device display against the coordinator, with multisig also whether the registration survived	
Move or new storage place	Seal inspected at the new location, location in the system sheet, descriptor printout moved along, heirs' package updated	
Incident at a manufacturer	Check at the manufacturer's own source whether you are affected. Then migrate according to plan, test amount first, trust no urgent email	
Device change or sale	Old device reset, seed moved only if its origin holds up, otherwise a new seed and a move of the coins, then as for "Change to the setup"	
Seal damaged or number wrong	Move the coins to a new, verified seed	
Change to the setup	Full drill (restore drill sheet), first address on all devices, test amount, records renewed. Multisig: print the descriptor again, swap it in every location, rebuild from it	
Life or holdings change	Separation, a death in your circle, new people in the know: check the threat model. Holdings one level of the matrix higher: bring the setup up to date, calmly	

⚠ **Every check on a backup costs a seal.** That is why you check thoroughly before sealing and afterwards only what is genuinely necessary. Note the new seal number right away, otherwise the next visual inspection is worthless. ⚠ **Measure the right time.** In a drill what counts is how long reading and entry take. Waiting for network confirmations says nothing about your backup. ⚠ **A check day is not a rebuild day.** First check, note, finish. Changes to the setup get their own date, otherwise you will not know afterwards what made the difference.
