Dice Log: roll your own seed

BitBox02 Diceware · 24 words (23 rolled, word 24 = checksum from the device) · Self-Experiment 1a

⚠ **Once filled in, this sheet is the key to everything held on this seed.** Never photograph it, never scan it, never type it into anything digital. After the check on the device, transfer the words into steel as described in chapter 5, then destroy this sheet or store it like the backup itself.

⚠ **For self-experiments:** A documented seed counts as compromised and is never used for real coins.

METHOD (SHORT VERSION, DETAILS IN THE BITBOX HOWTO)

You need: 5 casino dice · 1 coin · the printed BitBox word table (LookupTable) · pen · BitBox02 (also applies to the BitBox02 Nova: same firmware, same restore path)

1. Throw all 5 dice plus the coin together. Every die showing **5 or 6** is thrown again, only 1–4 count. (No coin? One extra throw: 1–3 = heads, 4–6 = tails.)
2. Read the dice from left to right (top to bottom if in doubt) and write them in below.
3. Look the word up in the word table: **die 1 = page**, **dice 2–4 = row**, **die 5 + coin = column**. Write the word in.
4. Repeat 23 times, then enter all words on the BitBox02: **"Restore from recovery words"** → 24 words.

[1] Page · [2] [3] [4] Row · [5] + (H/T) Column

20							
21							
22							
23							

Word 24 (checksum): After word 23 the BitBox02 shows **eight valid options**. Pick one of them at random, for example with the same scheme as the column: one die (1–4) plus the coin gives option 1–8.

TIME

Start: _____

End: _____

Rerolls (5/6) approx.: _____

NOTES / FAILED ATTEMPTS (FOR THE LOGBOOK)

VERIFICATION: WITHOUT THESE STEPS THE SEED IS WORTH NOTHING

- ☐ All 24 words checked on the device: **"Manage device"** → **"Show recovery words"**, word by word against this sheet.
- ☐ Words transferred into steel as described in chapter 5 (no photo, no text file). A backup card is at most a paper copy.
- ☐ This sheet destroyed or from now on stored like the backup itself.
